WINTER WHEAT VARIETY PERFORMANCE SUMMARY IN MONTANA

J. E. Berg, P. L. Bruckner, G.R. Carlson, A. Dyer, J. Eckhoff, G.D. Kushnak, K. D. Kephart, N. Riveland R.N. Stougaard, D.M. Wichman, W. Grey, D. Nash, R. Johnston and R. Larson

Introduction

The agronomic characteristics of winter wheat varieties recently developed or evaluated by the Montana Agricultural Experiment Station are compared in this publication with other varieties grown in the state. Varieties recommended for production in the respective districts of Montana are designated by an R. A brief description of each variety is given which may include a variety's particular advantages or disadvantages. information was extracted from the Intrastate Winter Wheat Nursery and the Soft White Winter Wheat Nursery Reports. These reports are prepared by research personnel of the Montana Agricultural Experiment Station. Where available, up to four years of yield data are shown for the varieties. In some years data are not available because of hail, frost, or other unavoidable causes.

Variety Testing Procedures

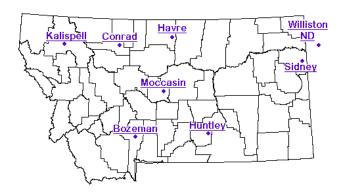

Fig. 1. Test Locations for Montana winter wheat performance tests in 2007.

Locations

Hard winter wheats were planted at 7 Montana and 1 North Dakota location (Fig. 1) including Conrad and Havre in the North Central district, Moccasin in the Central district, Huntley in the Southern district, Sidney and Williston, ND representing the Northeast district, Kalispell in the Northwest and Bozeman in the Southwest districts of the state. Separate tests comparing soft white winter wheat varieties were planted at Bozeman and Kalispell.

Entries

Names of commercially available entries evaluated in 2007 are listed with their origins, experimental designation, release year, and pedigrees in Table 2 for the hard winter wheats and in Table 15 for the soft white wheats. Forty-nine hard wheats are included in this summary comprising 33 varieties (18 public and 15 private) and 16 experimental lines (15 public and 1 private). Numbered entries preceded by a state designation [e.g. MT0495] (Montana), WA7976 (Washington)] experimental lines provided by the breeder of the originating state. Private experimental lines [e.g. BZ9W02-2051 (WestBred)] are submitted for testing on a fee basis. The soft white evaluation contains 16 varieties [15 soft white public (including 3 experimental lines), 1 private, and one hard wheat check (Neeley).]

Experimental Design and Seeding Methods

The Intrastate Winter Wheat Test consisted of a 49 entry test with 3 replicates. It was planted in the form of 7x7 lattice at all locations except Kalispell, where it was in a randomized complete block design. Plot size varied by location, from 35 ft² at Conrad to 60 ft² at Havre. Row number varies: Bozeman and Havre are 3-row, Conrad, Huntley, and Sidney are 4-row, Moccasin (5-row), Kalispell (7-row), and Williston (8-row) Row spacing at all locations was on 1 ft. centers, except at Williston and Kalispell (6" centers). All plots were seeded at 0.6 grams seeds/ft², which is roughly equivalent to 1 bushel per acre, except at Williston where the seeding rate was about 77 pounds per acre. Information on previous crop, planting date, fertilizer use and harvest date is available in Table 1.

Soft white winter wheat nurseries were planted similar to the hard wheat test, except all tests were planted in a randomized complete block design.

All seed for each nursery was treated with Dividend-XL seed treatment at recommended rates before planting.

Table 1. Summary of agronomic practices used on hard winter wheat performance trials in Montana in 2007. Fall nitrogen (N), phosphorus (P_2O_5) and potassium (K_2O) were preplant applied and incorporated.

			2006	Fertilizer				2007
	2006	2005	Planting		N			Harvest

Williston, ND	fallow	safflower	Sept. 13	52	-	30	0	July 26

Description of Data Collected

Yield

All rows of each plot were trimmed and measured and harvested using an experimental plot combine. Grain yields are reported in bushels per acre based on a 60 pound standard bushel weight. In addition to yields obtained in 2007, data is provided for two (2006-2007), three (2005-2007) and four (2004-2007) year averages for both hard and soft wheat entries tested during previous cropping seasons.

Test Weight

Test weight (pounds per bushel) were obtained for each plot by using Dickey-John Grain Analysis Computer (GAC) at some locations. Other locations use a Seedburo test weight apparatus. In this case, a sample is dropped through a funnel at a given height into a quart brass bucket, excess grain is removed by a flat stick then weighed on a gram scale, and grams per quart are converted into pounds per bushels.

Heading Date

Heading date is taken when 50% of the heads in a plot were extended above the flag leaf collar. Heading dates are recorded both in Julian days (number of days from January 1) and the actual calendar date.

Plant Height

Plant height was measured in inches from the soil surface to the top of the head, excluding the awns.

Grain Protein

Grain protein is sampled from a composite of all 3 replicated plots at each location. It is determined as a % by NIR (near infrared reflectance) on the Infratec whole grain analyzer. Samples are adjusted to a 12% moisture basis.

Winter Survival

Percent winter survival is estimated for each plot after initial spring green-up at locations where significant winter injury occurred. In 2007, only Williston had significant stand loss due to winter kill.

Table 11 contains information on % winter survival and associated yield in winter-kill environments from 2003 to 2007. The data summarizes 11 tests in which significant winter-kill occurred (test average for winter survival was less than 90%). Nine testing sites with winter-kill were in District 6 (Sidney and Williston) which is the most severe location for winter wheat survival of our testing locations.

Wheat Stem Sawfly

Wheat stem sawfly (WSS) is a persistent and economic problem for wheat growers in Montana. Currently, Montana wheat acreage infested by WSS is primarily in the north central (District 5), central (District 4) and south central (District 3) cropping districts. Host plant resistance in the form of stem solidness has been effective in reducing sawfly losses in both spring and winter wheat. Solid-stemmed winter wheats. 'Vanguard'.

'Rampart' and were released in 1995 and 1996, respectively. These 2 varieties were planted on 12% of the winter wheat acreage in the 2007 crop year (Rampart was the leading variety planted in the 2003 to 2006 crop years). Both these varieties have marginal winter hardiness. 'Genou', released in 2004, was the leading variety in 2007 with 16% of the winter wheat acreage. Genou has better winter hardiness and yield than Rampart or Vanguard.

Table 12 contains information on yield and % sawfly cutting at 8 testing locations where sawfly pressure was present during the years 2003-2007. The data is from Havre and a site 25 miles north of Havre. Solidness scores (rated on a 5-25 scale are shown for solid and semi-solid varieties in Table 14.

Coleoptile Length

Coleoptile length evaluation was performed in Bozeman under controlled (growth chamber) conditions. Twenty-five seeds per variety were planted in wetted vermiculite. After 15 days the coleoptile (sheath covering the emerging shoot that helps penetration to the soil surface) was measured. This test was replicated 3 times for each variety. Results from previous years are reported in Table 14. Long coleoptiles are generally longer than 4 inches, medium from 2.7-4 in, and short are under 2.7 in. Care should be taken not to plant short coleoptile varieties too deep.

Other Agronomic Characters

Table 14 contains information on grain maturity, chaff color, relative winter survival and straw strength for the hard wheat varieties listed in this publication. Table 18 has information on maturity, winter survival and lodging for soft white winter wheats.

Cereal Quality

Milling and baking characteristics for varieties are presented in Table 14. They are rated for each variety on a 1-5 scale (5 = superior). A quantitave polyphenol oxidase (PPO) was determined for varieties in the 2006 mill and bake evaluation. These varieties are reported in Table 14 as low to high. A lower value is associated with better Asian noodle quality.

Disease Reactions

Disease reactions for hard red wheat varieties are listed in Table 14. There is information on dwarf smut, stripe rust, stem rust and general leaf spot complex. Table 18, for soft white winter wheat, contains information on dwarf smut, snow mold, stem rust and stripe rust.

Statistical Analyses and Interpretation

The data collected at each winter wheat location was analyzed as a three-replication lattice or randomized complete block design. Least significant difference at the 0.05 probability level (LSD, p = 0.05) and coefficients of variation (CV) were calculated from analysis of variance at each location. The LSD is used to compare the performance of two specific varieties at a time. If the difference between two varieties exceeds the LSD this is interpreted as a true difference, because a difference between two varieties this large will only occur 5% of the time due to chance.

Tables 3 through 10 show 2007 data for hard winter wheat collected at all harvested experiment station sites. Tables 16 - 17 contain 2007 data for the soft white wheats. Where a variety has been in the test for two, three or four years, combined analyses of the yield data over years are presented.

Variety selection should be based on yield stability at a particular location over a period of years. Selection should also consider test weight, winterhardiness, heading date, plant height, protein and disease resistance.

2007 Test Conditions

Statewide winter wheat yields were moderate and projected by the Montana Agricultural Statistics Service at 38 bu/a for 2007 compared to 43 bu/a for the 2006 harvest year. The harvested acreage in 2007 was 2.19 million acres (total production = 83.2 million bu) compared to 1.92 million acres in 2006 (82.6 million bu). Rainfall for the 2006-2007 winter wheat season was generally adequate to above average at all locations. Test yields ranged from 55 bu/a at Havre to 105 bu/a at Bozeman. Test weight averaged 60.4 lb/bu across all locations (Havre, Williston, and Kalispell were below 60 lb/bu). Winterkill at Williston (59% survival across varieties, range 7-90%) reduced yields of

susceptible varieties, while Sidney experienced some stand reduction. Higher than average spring rainfall resulted in increased plant height for 2007 (37in average compared to 31 inches across all locations in 2006).

Stripe rust at Bozeman and Kalispell was a factor in yield reduction for highly susceptible varieties (Ripper, Neeley, NuWest, and NuSky). Stripe rust was less of a factor in overall yield reduction at both these locations in 2007 with yield averages of 105 bu/a at Bozeman and 91 bu/a at Kalispell, compared to 80 and 60 bu/a, respectively, in 2006. There was sawfly cutting at the Havre Experiment Station averaging 27% of stems cut across varieties (range = 0-57%).

Protein content averaged near 13% across all locations (location range = 10.0 - 14.4%) tested. Sidney and Moccasin were below 12%. The range of genotype means across all locations was 11.7-14.9%.

Leading winter wheat varieties planted for 2007 were Genou (16.1%), CDC Falcon (13.4%), Rampart (9.7%) Neeley (7.6%), Ledger (5.9%) and Morgan (5.5%).

Dwarf Smut (TCK)

Dwarf smut (TCK) can be controlled with 'Dividend' seed treatment (see page 5). Dwarf smut or dwarf bunt (*Tilletia controversa* Kuhn) is a fungal disease that occurs in areas where winter wheat is subjected to prolonged snow cover or unfrozen ground. The planting of dwarf smut resistant varieties (Promontory and Lewjain are currently recommended) as one practical means of control. The amount of wheat lost each year because of dwarf smut is small in relation to the state's total crop, but individual operators may experience severe losses in heavily infested, localized areas.

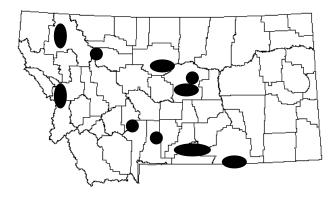

Fig. 2. Known areas of dwarf smut (TCK) infestations.

If you farm in the vicinity of one of the shaded areas in the map (Figure 2.), you would be well advised to observe closely your winter wheat crop and consider planting a resistant variety (Tables 14 and 18) or use 'Dividend' seed treatment, only.

What Recommendation by MAES Means

Classification of winter wheat varieties determined on a yearly basis by the Montana Agricultural Experiment Station (MAES) Wheat This 16 member Variety Release Committee. committee is composed of one wheat breeder, one cereal or forage quality scientist, one plant pathologist, one entomologist, one weed scientist, one cropping systems specialist, six Research Center agronomists, one manager from both the Montana Foundation Seed program and the Montana Seed Growers Association, one Montana Wheat and Barley Committee member and one representative of the Montana Agricultural Experiment Station Advisory Board.

A variety is eligible for recommendation when a minimum of 16 location-years of performance data is obtained from the Montana State University statewide winter wheat performance trials. Test results indicate that the variety is equal to or superior in overall merit to specified check cultivars and has end-use quality equal to or exceeding currently recommended varieties. For varieties originating from private companies, recommendation is considered only at the request of the company when adequate data is available.

Recommendations of varieties are considered on a case by case basis. Yield performance of a variety is an important criteria, but also considered are test weight, grain protein content, winter survival, pest resistance and end-use quality data. In general, yield needs to be at least equal to currently recommended varieties in a particular district, unless the variety is being recommended for a specific purpose, e.g. winter hardiness, sawfly resistance. For example, Rampart and Vanguard, which are not competitive in the absence of wheat stem sawfly, are recommended in Districts 3, 4 and 5 for sawfly areas only. Only five varieties are recommended for the Northeast district due to severe winter conditions and a higher probability of stem rust in this region. Thus varieties

recommended for District 6 must have higher winter survival and stem rust resistance.

If a serious defect in the variety is identified during performance testing, the variety will not be recommended. Examples of defects resulting in non-recommendation include: high probability of winter-kill, low grain protein, low baking quality, etc.

Lack of variety recommendation by MAES may occur due to a decision by the originating company not to test the variety in statewide performance trials. In this case the lack of recommendation is due to inadequate or no data rather than a specific varietal defect.

Montana produces primarily hard red winter and hard red spring wheats. Continuous improvement of the milling and/or baking quality of Montana grown winter wheat is one of many objectives of the Montana Agricultural Experiment Station breeding and cultivar development program. All varieties recommended by the Montana Agricultural Experiment Station have been evaluated and found to be acceptable for milling and baking performance by the Cereal Quality Laboratory at Montana State University.

The quality of Montana recommended varieties, if grown and marketed within their respective classes, is acceptable by domestic users. Montana's future as a hard red and hard white winter wheat producing state for both the domestic and export markets rests on the quality of the product.

Producing Winter Wheat

<u>Plant CERTIFIED CLASS SEED</u> of varieties <u>RECOMMENDED</u> by the Montana Agricultural Experiment Station.

Seed Treatment

Treat all winter wheat seed with a recommended fungicide to reduce losses caused by cereal smut or other seed-borne diseases. Several non-mercurial compounds are registered for grain seed treatment.

Dwarf smut (bunt) can be controlled with difenoconazole. Dividend® contains this compound and is available in Montana. If you farm in a dwarf smut area contact your seed dealer or chemical

representative for more information about this seed treatment. See page 4 for known areas of dwarf smut infestations.

Diseases are best controlled when all seeds are coated with a seed treatment. <u>Do not over-treat-Follow recommendation of manufacturer of product</u> as to rate.

Truck-mounted seed treaters, which apply the fungicide as the seed is augered into the drill box, do a good job of treating if operated according to manufacturer's specifications.

Drill box treatments are not effective for general use.

When using any pesticide materials, <u>read the</u> <u>information on the label</u> as to rate of application, specific uses, methods of handling, precautions, etc.

Seeding Rate and Date

The following rates and dates for seeding are general (Figure 3). The heavier seeding rate, where indicated, is applicable to plump seed of high test weight (above 60 lbs/bu) or for seed having a kernel size larger than normal for most other varieties. The lighter rates are for the smaller seeded varieties or when test weight is below normal for larger seeded varieties. Seeding rates may be lower if adequate nitrogen and phosphorus amounts are applied at planting.

Winter wheat seed lots may vary in the number of seeds per pound depending on the ratio of large-to-small seeds in a seed lot. The average is approximately 15,000 seeds per pound. A precise count of the number of seeds per pound should be made on your seed lot to help calibrate your drill. You can also calculate how many pounds of seed you will need to plant an acre.

Figure 3. Seeding rate and date for winter wheat

Districts	Dryland	Irrigated	Date of Seeding
5,6 1,2,3,4	30-60 30-60 (10-20 seeds/sq. ft.)	60-75 60-75 (20-25 seeds/sq. ft.)	Sept. 1-15 Sept. 10-25

As to seeding date -- DO NOT SEED TOO EARLY in areas where root rot diseases are prevalent. In areas where <u>Cephalosporium</u> stripe, wheat streak mosaic virus or other root rot diseases have caused losses, delay seeding until the soil temperature in the seed zone will stay below 55°F except for brief periods during the day. In the southern half of Montana, this is usually September 10 to 20. In Districts 5 and 6, seed between September 1 and Cooler soil temperatures slow root development and reduce the probability of winter root injury and invasion by soil-borne organisms. To reduce the incidence of root and foot rots, plant winter wheat on land previously seeded to other crops such as barley, oats or spring wheat. Extreme seeding delay, however, reduces seedling vigor and increases chances of winter-kill.

Seeding Depth

Set the drill to place the seed 1 to 2 inches below the soil surface. Deeper seeding reduces tillering and lowers crop yields. With the furrow drills, winddriven soil particles settle in the furrows covering the seed deeper than desired.

Yield in Winter Wheat as Influenced by Percent Stand

During periods of winter injury farmers are frequently faced with a decision as to whether or not a field should be torn up and re-seeded. A 40 to 50 percent winter wheat stand, if general over field, may produce as much as re-seeded spring wheat. Thinner stands will likely demand more attention for weed control.

The guidelines for evaluating winter wheat stands are to determine the average number of healthy plants per square yard. We suggest making a square frame out of 3/8 inch rod. Walk the field in a zigzag pattern counting at ten random locations.

Fields that have 80 or more plants per square yard will probably produce more than if replanted to spring wheat (information taken from 1995 Master's Thesis, "Critical Overwintering Plant Population for Successful Winter Wheat Production in Montana" by Doug Holen).

Additional Descriptive Information for Winter Wheat Varieties

Hard Winter Wheat

New for the 2008 Bulletin:

<u>Alice</u> – hard **white** winter wheat released by South Dakota in 2006. Alice is an early maturing, white chaffed, short semidwarf wheat. In the initial year of testing in Montana, Alice had above average yield and test weight, average protein, and below average winter hardiness. Alice appears moderately resistant to stripe rust. <u>PVP</u>, <u>Title V has</u> been issued.

<u>Darrell</u> – hard red winter wheat released by South Dakota in 2006. Darrell is an early maturing, white chaffed, medium height semidwarf wheat. In the initial year of testing in Montana; Darrell had above average winter hardiness and average yield, test weight, and protein. Darrell appears moderately susceptible to stripe rust. <u>PVP</u>, <u>Title V has been issued</u>.

<u>Hawken</u> – hard red winter wheat released by AgriPro in 2007. Hawken is an early maturing, white chaffed, short semidwarf wheat. In the initial year of testing in Montana, Hawken had above average test weight and average yield, protein, and winter hardiness. Hawken is resistant to stripe rust. PVP, Title V has been issued.

<u>Ripper</u> – hard red winter wheat released by Colorado in 2006. Ripper is an early maturing, white chaffed, short semidwarf wheat. In the initial year of testing in Montana, Ripper had above average yield and test weight, below average protein, and poor winter hardiness. Ripper is very susceptible to stripe rust. <u>PVP</u>, Title V has been issued.

Varieties previously in bulletin:

BigSky - is a broadly adapted, high-yelding hard red winter wheat cultivar with medium maturity, good foliar disease resistance, and dual purpose (bread and Asian noodle) end-use quality. Yield performance is similar to Judith, Kestrel, Neeley and Rocky and higher than Tiber and Erhardt. Test weight is superior to all these varieties. BigSky is of medium maturity heading 1-2 days later than Judith, similar in height to Tiber, but with strong, stiff straw. BigSky is resistant to stem rust but susceptible to leaf and stripe rust. Resistance to Septoria and tan spot is good. Milling and baking qualities of BigSky are within acceptable ranges.

BigSky was released by the Montana AES in the fall of 2001. This variety is protected under the Plant Variety Protection Act and can only be sold or advertised by variety name as a class of certified seed.

Bond CL – hard red winter wheat was developed by the Colorado Agricultural Experiment Station and released to seed producers in 2004. Bond CL was released based on its resistance to Biotype 1 of the Russian wheat aphid, its tolerance of imizamox (IMI) herbicide, and its adaptation to dryland production in Eastern Colorado and the west-central Great Plains, and improved bread and baking qualities relative to available IMI-tolerant cultivars. Bond CL is a medium-early maturing semidwarf. It is susceptible to stem rust, leaf rust, and very susceptible to stripe rust. It is moderately susceptible to wheat streak mosaic virus. PVP with Title V option has been issued. Additionally, the CLEARFIELD gene is patented.

Bynum – a CLEARFIELD (CL) wheat with imidazolinone tolerance, developed by the Montana Agricultural Experiment Station in 2005 and licensed to WestBred LLC. Bynum is a solid stem "Rampart-type" CLEARFIELD hard red winter cultivar similar in most characteristics to Rampart. It is lower yielding than Norris and similar in yield to MT1159CL. Bynum has a solid stem, high grain protein, and excellent bread baking quality. Bynum is resistant to stripe rust and has some resistance to stem rust. PVP, Title V has been issued. Additionally, the CLEARFIELD gene is patented.

<u>Carter</u> – a semi-solid stem hard red winter wheat released by WestBred LLC in 2007. Carter is a medium maturity semidwarf wheat. It has average yield, test weight, and winterhardines and good protein. Carter is resistant to stem rust and moderately resistant to stripe rust. Carter has average milling and above average baking quality. PVP will be applied for.

<u>CDC Buteo</u> – hard red winter wheat developed by the Crop Development Center, Saskatoon, Saskatchewan and registered in 2001. It is being tested by WestBred LLC. CDC Buteo is a medium to late maturity standard height wheat. It has average yield and protein with good test weight and winterhardines. CDC Buteo is susceptible to stripe rust. It is rated as having acceptable milling and baking quality. <u>PVP</u>, <u>Title V has been applied for.</u>

CDC Falcon – hard red winter wheat developed by the Crop Development Center, Saskatoon, Saskatchewan and registered in 1998. Licensed to WestBred LLC. Superior stem and leaf rust resistance over all current winter wheat varieties in western Canada. High yield, good winterhardiness, semidwarf, short strong straw, especially good for direct seeding and straight cut harvest. CDC Falcon is moderately resistant to stem rust and susceptible to stripe rust. It is rated as having acceptable milling and baking quality. CDC Falcon is protected under the Plant Variety Protection Act, but not the Title V option.

Genou – a solid-stem hard red winter wheat with improved yield potential and cold tolerance relative to Rampart. Stem solidness is relatively good, although not as good as Rampart. Test weight, maturity, plant height, grain protein, and end-use qualities are similar to those of Rampart and Vanguard. Genou is susceptible to both stem and stripe rust. Foundation seed was made available in fall of 2004. Genou (French for knee) is named after a school house in The Knees area of Chouteau County. PVP with Title V option has been issued.

Hatcher – hard red winter wheat was developed by the Colorado Agricultural Experiment Station and released to seed producers in 2004. Hatcher was released based on its resistance to Biotype 1 of the Russian wheat aphid and its adaptation to nonirrigated production in Eastern Colorado and the west-central Great Plains. Hatcher is an awned, whie-chaffed, medium maturity, semidwarf wheat. It is moderately susceptible to stripe rust, resistant to stripe rust, susceptible to wheat streak mosaic virus and barley yellow dwarf virus, and heterogeneous for resistance to the Great Plains biotype of the Hessian fly. Industry has rated Hatcher as acceptable for milling and baking quality. PVP with Title V option has been issued.

<u>Hyalite</u> – a CLEARFIELD (CL) wheat with imidazolinone tolerance, developed by the Montana Agricultural Experiment Station in 2005 and licensed to WestBred LLC. Hyalite is a good yielding hard **white** winter CLEARFIELD cultivar. Hyalite is significantly higher in yield than other CLEARFIELD checks, similar in yield to Neeley, and better yielding than NuSky and NuWest. Hyalite has average test weight, good crop tolerance to herbicide, and is relatively early in heading compared to Montana varieties. Hyalite is resistant to stem rust and very susceptible to stripe rust. Grain protein of Hyalite is above average and milling and baking characteristics are acceptable.

PVP, Title V has been issued. Additionally, the CLEARFIELD gene is patented.

Developed Jagalene from the cross "Abilene/Jagger" and released by AgriPro in 2003. Jagalene is a hollow-stemmed hard red winter variety. It has been tested in Montana Intrastate Trials and Off-Station trials during the 2003 through 2005 seasons. It has exhibited consistently high yields in Crop Reporting Districts 1 through 5. Jagalene has excellent test weight ranking higher than all checks. It is a semi-dwarf with height shorter than all checks except CDC Falcon. Lodging resistance is very good. It has early heading, nearly 6 days earlier than Neeley and earlier than all checks. Winterhardiness levels would be considered average to below average. It has excellent general disease resistance, including the entire soil virus complex, stem rust, stripe rust, tan spot and septoria. Protein is average compared to the checks. Jagalene has excellent milling and very good baking characteristics. This variety is protected under the Plant Variety Protection Act and can only be sold or advertised by variety name as a class of certified seed.

<u>Jerry</u> – hard red winter wheat released by North Dakota State University in 2001. It is white-chaffed and awned and similar in maturity to Roughrider. Jerry has good winter hardiness and is a top yielder in areas where winterkill can occur. Jerry has average test weight and protein under Montana conditions. It has good resistance to prevalent races of stem and leaf rust and is moderately resistant to stripe rust. Mixing properties and baking performance are equal to Roughrider.

<u>Ledger</u> – hard red winter wheat developed by WestBred LLC and released in 2004. Ledger is an early maturing wheat, semidwarf wheat with average winter hardiness. The Montana Intrastate Winter Wheat Program testing shows this variety to be of average yield and protein with above average test weight. Ledger is moderately resistant to stripe rust and susceptible to stem rust. Milling and baking characteristics are acceptable. <u>Ledger is protected under the Plant Variety Protection Act, but not the Title V option.</u>

Morgan – Developed by the Crop Development Centre, University of Saskatchewan. Western Plant Breeders was granted the production rights. It is an awned, white chaffed, semidwarf hard red winter wheat. The spike is tapered, mid-dense and lacks a waxy bloom. The glumes are medium long, medium wide, no pubescence and have oblique shoulders. Morgan is resistant to stem rust, moderately susceptible to leaf rust, and very

susceptible to stripe rust. <u>Morgan is protected</u> under the Plant Variety Protection Act, but not the <u>Title V option</u>.

MT1159CL - a CLEARFIELD (CL) wheat with imidazolinone tolerance, developed by the Montana Agricultural Experiment Station in 2004 and licensed to WestBred LLC. MT1159CL is a medium maturity, semidwarf hard red wheat. MT1159CL has moderate winter hardiness and production should be restricted to areas where winter kill risk is moderate. Crop tolerance to Beyond herbicide is equal or superior to Above under Montana conditions. MT1159Cl has yield potential similar to Above, medium test weight, and fair end-use qualities. MT1159CL is moderately resistant to stripe rust and very susceptible to stem rust. PVP, Title V has been issued. Additionally, the CLEARFIELD gene is patented.

<u>Neeley</u> – Developed and released in 1980 by USDA-ARS and the Idaho Agricultural Research Station. It is a hard red wheat. It is a semidwarf variety with intermediate maturity. Neeley is susceptible to stem rust and very susceptible to stripe rust. Neeley has average protein and winter-hardiness.

Norris - a CLEARFIELD (CL) wheat with imidazolinone tolerance, developed by the Montana Agricultural Experiment Station in 2005 and licensed to WestBred LLC. Norris is a high yielding hard red winter CLEARFIELD cultivar that could replace MT1159CL once seed becomes available. Norris is significantly higher in yield than other CLEARFIELD checks and similar in yield to Neeley. Norris has high test weight, good crop tolerance to herbicide, and is relatively early in heading compared to Montana varieties. Grain protein of Norris is relatively low, but milling and baking characteristics are acceptable. PVP, Title V has been issued. Additionally, the CLEARFIELD gene is patented.

<u>NuDakota</u> – hard **white** wheat released by AgriPro in 2006. It is a white chaffed, early maturing, semidwarf cultivar. In limited testing (1 year) in the Montana Intrastate Winter Wheat Test, NuDakota has average yield, test weight, and protein. It has below average winterhardiness. NuDakota is resistant to stripe rust. It has fair milling and baking characteristics. <u>PVP with Title V option has been issued</u>.

<u>NuSky</u> – hard **white** winter wheat to be released by the Montana Agricultural Experiment Station as a public release in the fall of 2001. High yielding, medium maturity, good winterhardiness, intermediate height, good straw strength, average grain protein, and good milling, bread-baking, and Asian noodle characteristics. Like NuWest, NuSky is resistant to stem rust and susceptible to stripe rust. Field performance and end-use quality characteristics are very similar to NuWest.

NuWest – Developed by the Montana Agricultural Experiment Station. It was released in 1994 and is currently licensed to General Mills. NuWest is a hard white winter wheat of intermediate height. The spike is awned, white chaffed and erect at maturity. The kernels are hard, white and elliptical. The germ is large, with a mid-long brush, cheeks are rounded with a narrow straight crease. There is approximately one red kernel per 1500 white kernels. NuWest is resistant to prevalent races of stem rust found in Montana. It is susceptible to leaf rust, wheat streak mosaic virus and dwarf bunt. It is resistant to stem rust, very susceptible to stripe and moderately susceptible rust, Cephalosporium stripe. It is susceptible to Russian wheat aphid and the wheat stem sawfly. variety is protected under the Plant Variety Protection Act and can only be sold or advertised by variety name as a class of certified seed.

Paul – a hollow-stemmed, winter-hardy, high quality hard red winter wheat with yield potential similar to Judith and Neeley. Has improved winter hardiness and baking quality relative to Neeley. Test weight of Paul is low but slightly higher than that of Judith. Paul is of medium to late maturity, relatively short, with straw strength similar to Neeley. Paul is resistant to stem rust, but susceptible to leaf and stripe rust. Foundation seed was available in fall of 2003. 'Paul' is named in honor of Paul L. Brown's long-term contributions to Montana dryland agriculture. PVP has been abandoned.

<u>Promontory</u> – Released by the Utah Agricultural Experiment Station in 1991. It is a hard red winter wheat of medium height with awns and bronze chaff. Promontory is a high yielding line with excellent test weight. It has poor winterhardiness. Promontory is resistant to dwarf bunt and stripe rust and susceptible to stem rust.

<u>Pryor</u> – hard red winter wheat released by Western Plant Breeders in 2002. Pryor is a white chaffed, awned variety with short stature and medium winter hardiness. Pryor is a high yielding variety with average test weight and below average protein. It is susceptible to stem rust and stripe rust and moderately resistant to leaf spot complex. Pryor has average milling and baking characteristics. <u>This</u>

<u>variety is protected under the Plant Variety</u> Protection Act without the Title V option.

Rampart – Released by the Montana Agricultural Experiment Station in 1996. It is an awned, red chaffed, solid-stemmed hard red winter wheat variety. The kernel is long with a sloping back and a heavy brush. The cheeks are rounded to angular with an open crease. Rampart is resistant to the wheat stem sawfly. It is resistant to prevalent races of stem rust. Rampart is resistant to stripe rust. It is susceptible to leaf rust, dwarf smut and the Russian wheat aphid. Rampart has excellent milling and baking properties and is a sister line to Vanguard.

Rocky – A pure line selection from Centurk developed and released by Nickerson American Plant Breeders (now Agripro Seed Company) in 1978. Rocky is a hard red winter wheat that has white glumes and awns. It is similar in most characteristics to Centurk but differs in glume shape and beak length and has better resistance to soil born mosaic. Rocky is resistant to stem rust, but susceptible to stripe rust. Rocky tends to be about three to four days later in heading than Centurk but dries down for harvest as early as Centurk. Rocky is adapted to the same areas as Centurk, but has superior yields under most conditions. Rocky has average milling and baking qualities when compared to Redwin.

<u>Tiber</u> – A standard height hard red winter wheat variety released by the Montana Agricultural Experiment Station in 1987. Tiber was selected from a Redwin population based on its tolerance to the leaf spot disease complex. Tiber is a bearded, brown chaffed, stiff-strawed variety. It has a high yield potential, good shatter resistance and good winter-hardiness (similar to Redwin). Tiber's resistance to lodging and shattering is equal to Redwin; shorter in straw height than Winalta. Tiber has moderate resistance to the leaf spot complex, but is susceptible to dwarf smut, stem rust, and stripe rust. Tiber has average milling and baking quality.

<u>Vanguard</u> — Developed by the Montana Agricultural Experiment Station and released in 1995. Vanguard is the first sawfly-tolerant winter wheat released in Montana since 1965. It is resistant to the wheat stem sawfly. It was released as an emergency measure to reduce yield losses due to the sawfly. Vanguard has awned spikes, with white chaff and the straw is white. Vanguard is moderately resistant to stripe rust, has some resistance to stem rust, leaf rust and susceptible to dwarf smut.

<u>Wahoo</u> – hard red winter wheat released jointly by Nebraska and Wyoming in 2000. Wahoo is a semidwarf, early maturing white chaffed variety. It has above average yield, below average test weight, and average protein under Montana conditions. Wahoo is moderately resistant to stem rust and leaf rust, but susceptible to stripe rust, wheat streak, and barley yellow dwarf viruses. Milling and baking characteristics are acceptable. This variety is protected under the Plant Variety Protection Act and can only be sold or advertised by variety name as a class of certified seed.

<u>Wendy</u> – hard white wheat released by South Dakota in 2006. It is a white chaffed, early maturing, short semidwarf cultivar. In limited testing (1 year) in the Montana Intrastate Winter Wheat Test, Wendy has average yield and above average test weight and protein. It has average winterhardiness. Wendy is resistant to stripe rust. It has acceptable milling and baking characteristics. PVP with Title V option has been issued.

<u>Willow Creek</u> – awnletted wheat specialty crop for winter cereal **forage** released by Montana AES in 2005. Willow Creek is a white chaffed, tall, very late maturing variety with good winterhardiness. In limited (1 year) Montana Intrastate Winter Wheat Test, Willow Creek has low grain yield and test weight, but good protein. Willow Creek is resistant to stripe rust. Willow Creek has poor milling and baking characteristics.

Yellowstone – hard red winter wheat developed by the Montana Agricultural Experiment Station and released to seed growers in 2005. Yellowstone is a very high yielding winter hardy variety with medium test weight, maturity, height, and grain protein. Yellowstone has excellent baking and good Asian noodle quality. It is moderately resistant to TCK smut and resistant to stripe rust, but susceptible to stem rust. Yellowstone potentially could occupy acreage currently planted to Neeley, Tiber CDC Falcon, Paul, Promontory, and Morgan. PVP, Title V has been issued.

Soft White Winter Wheat

New for the 2008 Bulletin:

<u>Xerpha</u> – soft white winter wheat released by Washington in 2007. Xerpha is a medium to late maturing, white chaffed semidwarf wheat. In the initial year of testing in Montana, Xerpha had above average yield and average test weight and protein. Xerpha appears resistant to stripe rust.

Varieties previously in bulletin:

<u>Eltan</u> – Developed cooperatively by USDA-ARS and the Washington Agricultural Experiment Station and released jointly by the Washington, Oregon and Idaho AES in 1990. Eltan is a semidwarf, soft white winter wheat. The spike is awned and white chaffed. It is resistant to dwarf bunt (TCK), snow mold and common bunt. Eltan is moderately susceptible to prevalent races of stripe rust, but susceptible to stem rust and leaf rust.

<u>Finch</u> – Developed by the Washington AES and released in 2002. Finch is an awned, white chaffed medium-late maturing soft white winter wheat. It has resistance to strawbreaker foot rot, stripe rust and powdery mildew. Yield potential similar to Eltan, test weight better than Eltan in limited Montana testing.

<u>Hubbard</u> – Tall semidwarf with good straw strength developed by the Idaho AES and released in 2000. Good resistance to stripe rust; susceptible to cephalosporium stripe, strawbreaker foot rot, Septoria tritci blotch, common bunt and dwarf bunt. Yield potential and test weight better than Eltan in limited Montana testing. <u>This variety is protected under the Plant Variety Protection Act and can only be sold or advertised by variety name as a class of certified seed.</u>

<u>Kmor</u> – developed by the USDA-ARS and the Washington Agricultural Experiment Station. Kmor is a semidwarf, white chaffed, soft white winter wheat. It was released jointly by the Washington, Oregon and Idaho AES in 1990. Kmor is resistant to stripe rust, moderately resistant to Cephalosporium, common bunt, strawbreaker foot rot, and dwarf smut. It is susceptible to snow mold, leaf rust and stem rust.

<u>Lambert</u> – Developed by the Idaho AES and jointly released in 1995 by the Idaho, Oregon and Washington Agricultural Experiment Stations. Lambert is an awned, semidwarf, soft white winter wheat, The kernels are soft, white and ovate, with a mid-deep crease and a mid-sized germ. It is resistant to stripe rust, more tolerant than Stephens to both Cephalosporium stripe and snow mold. Lambert is susceptible to strawbreaker foot rot and dwarf bunt. Lambert's quality characteristics have been accepted by industry.

<u>Lewjain</u> – developed and jointly released by the Washington AES and the USDA-ARS in 1982. It is a semidwarf, soft white winter wheat. It is white chaffed, awned, with a common head type. Lewjain is resistant to some races of common smut

and dwarf smut. In the adult stage it is resistant to stripe rust and moderately resistant to Cephalosporium gramineum. It is susceptible to leaf rust, stem rust, flag smut and foot rot.

MAC-1 – soft white winter developed by Plant Breeders 1, Moscow, ID in 1992. Currently licensed to Lake Seeds in Ronan, MT. Above average yield and test weight in first year of testing at Bozeman and Kalispell. High protein for soft white winter wheat. This variety is protected under the Plant Variety Protection Act and can only be sold or advertised by variety name as a class of certified seed.

<u>MacVicar</u> – Jointly released in 1980 by the Washington AES and the USDA-ARS. The spike is awned, white chaffed, fusiform and lax. Kernels are white, mid-long, ovate to elliptical, the crease is narrow and shallow. The brush is mid-long and cheeks are rounded. The glumes are glabrous, mid-long, mid-wide with narrow acuminate beaks and shoulders are wanting.

<u>Masami</u> - developed by Washington State University and released, jointly with Idaho, in 2004. Masami is an awned, white-chaffed semidwarf soft white winter wheat. It is targeted to replace Eltan and Madsen in all precipitation zones of eastern Washington as it consistently produces higher grain yields, especially in those areas where foot rot is a problem for Eltan and cold hardiness is a problem for Madsen. When compared to Eltan, Madsen, and Rod, extensive data indicate that Masami is equal or superior in grain yield, cold-hardiness, end-use quality, and resistance to stripe rust and foot rot. PVP has been applied for without Title V option.

<u>Rod</u> – Developed by Washington State University in cooperation with USDA-ARS. Released jointly by the Washington, Oregon and Idaho AES. Rod has some winter-hardiness (similar to Stephens), moderately weak straw and medium-late heading. Resistant to local races of stripe rust and common bunt, but susceptible to dwarf bunt, stem rust, leaf rust and snow mold.

<u>Simon</u> – Early maturing semidwarf developed by the Idaho AES and released in 2003. Yield potential similar to Eltan, test weight better than Eltan in limited Montana testing <u>This variety is protected under the Plant Variety Protection Act and can only be sold or advertised by variety name as a class of certified seed.</u>

Plant Variety Protection

The Plant Variety Act, signed into law in 1970, offers legal protection to developers of new varieties of plants which reproduce sexually – that is, through seeds. The law provides for a Plant Variety Protection Office in the U.S. Department of Agriculture. The office receives and processes applications and when "novelty" is established, issues a certificate granting protection rights specified by the applicant.

The owner (or developer) holding a "certificate of protection" has complete control over the variety for 20 years. The law provides two types of protection:

1. Without Seed Certification

The owner of the protected variety may exclude others from reproducing the variety, selling it, offering it for sale, importing or exporting it, or use it in the commercial production of a hybrid or a different variety without permission. In this sense, the owner of a protected variety may bring civil damage action against anyone who infringes upon his rights.

2. Certified Seed Option

The owner may specify that the seed of his variety "...be sold or advertised only as a class of Certified Seed". Production and sale of such seed by variety name, when not certified, constitute a violation of the Federal Seed Act. This means of protection may be used extensively for publicly as well as privately developed varieties.

Amendments to the Plant Variety Protection Act (PVPA) have passed both houses of Congress and been signed into law by the President. These amendments went into effect in 1995. The farmers exemption has been changed for new varieties. Seed for varieties issued a certificate after April 4, 1995, may only be purchased from the owner or his agent. A farmer can only save seed of these varieties for use on his own farm and cannot sell seed of the protected variety to his neighbor.

A variety protected under the certification option does not permit a farmer producing seed to sell or offer for sale <u>or advertise by variety name</u> unless it is certified. Sale of such seed by variety name as uncertified seed will constitute a violation of the Federal Seed Act. Interstate movement of seed is subject to inspection by Federal Seed Control officials. Seed within the state is subject to inspection by State Department of Agriculture inspectors.

Owners of protected varieties will give public notice that their variety is protected by affixing to the label or container the words: "Unauthorized Propagation Prohibited" or the words, "Unauthorized Seed Multiplication Prohibited". Producers must check the label (tag) or the container for the above wording.

Publication reviewed and/or data supplied by the following Montana research staff:

Mr. Jim Berg, Research Associate, Plant Sciences and Plant Pathology Department, Montana State University, Bozeman, Montana.

Dr. Phil Bruckner, Professor, Winter Wheat Breeding, Plant Sciences and Plant Pathology Department, Montana State University, Bozeman, Montana.

Mr. Gregg Carlson, Superintendent and Associate Professor of Agronomy, Northern Agricultural Research Center, Havre, Montana.

Dr. Alan Dyer, Assistant Professor, Plant Sciences and Plant Pathology Department, Montana State University, Bozeman, Montana.

Dr. Joyce Eckhoff, Associate Professor of Agronomy, Eastern Agricultural Research Center, Sidney, Montana.

Dr. Bill Grey, Adjunct Assistant Professor and Montana Foundation Seed Stocks Manager, Plant Sciences and Plant Pathology Department, Montana State University, Bozeman, Montana.

Mr. Robert Johnston, Research Associate, Plant Sciences and Plant Pathology Department, Montana State University, Bozeman, Montana.

Dr. Ken Kephart, Superintendent and Associate Professor of Agronomy, Southern Agricultural Research Center, Huntley, Montana

Dr. Gregory D. Kushnak, Superintendent and Associate Professor of Agronomy, Western Triangle Research Center, Conrad, Montana.
