

## **A MOTION TO RELEASE MT1173 AS A CLEARFIELD SPRING WHEAT FOR DISTRICTS 2-6 UNDER DRYLAND CONDITIONS**

**Luther Talbert, Nancy Blake, Hwa-Young Heo**

We propose licensing the line to a BASF-approved entity partner for commercialization.

MT1173 was derived from the cross of Vida//8209-1/Vida made in 2004 to be used as a Clearfield wheat. ‘8209-1’ was an experimental line derived from the cross of CDCTeal11A//McNeal/SWP965001 made in 2003. SWP965001 is a WestBred line descended from ‘Fidel’ with TaAHASL1D (als1) gene for resistance to imidazolinone herbicides. CDCTeal11A is a Canadian wheat variety with TaAHASL1B (als2) gene for resistance to imidazolinone herbicides. The experimental line that became MT1173 was assayed for herbicide resistance and presence of the two resistance genes via PCR. MT1173 was tested following BASF protocols for herbicide resistance in qualification trials managed by Ed Davis (Land Resources and Environmental Sciences)

Four sets of data provided justification for release of MT1173. These include two years of results from the statewide Advanced Yield Trial (AYT), one year of data from the Preliminary Yield Trial, six locations of data from herbicide qualification trials, and data from the Montana Cereal Quality Lab.

Data from the AYT in 2012 and 2013 shows that MT1173 had grain yield (Table 1) similar to Vida and higher than most other varieties at most sites. Test weight of MT1173 was lower than Vida, and most similar to Duclair (Table 3). Grain protein was similar to Vida (Table 4). MT1173 heads slightly later than Vida is approximately the same height (Table 5). MT1173 has hollow stems similar to Reeder and McNeal (data not shown).

Data from the Preliminary Yield Trial (PYT) grown in 2011 are shown in Tables 5 and 6. Table 5 shows the grain yield of MT1173 was lower than Vida though higher than most other varieties. Table 6 shows that MT1173 was a little later and shorter than Vida, with lower test weight.

End-use quality parameters were measured over a two year period in four locations each year for the AYT (Tables 7 and 8). MT1173 was similar to Vida for most end-use quality characteristics. Data from a sister line to MT1173, designated MT1172, is included in the CQL analysis. MT1173 tended to have higher values for most characteristics associated with dough strength than MT1172. These traits included mixing time and tolerance, as well as water absorption for bake analysis and mixograph analysis. The higher strength of MT1173 relative to MT1172 and Vida was the basis for selecting this line for release instead of MT1172.

The rights to use of the genes for resistance to imidazolinone are owned by BASF. BASF requires six herbicide qualification trials over a two-year period to insure that the genes provide ample herbicide resistance. The qualification trials were conducted in 2012 and

2013 by Ed Davis (LRES). Data on herbicide tolerance and grain yield is shown in Table 9. The key data from these trials are that there was no injury due to herbicide in any of the trials. BASF has approved the use of MT1173 as a Clearfield variety.

This variety will need to be licensed to an entity with an approved commercialization license from BASF.
